In other words, a rational expression is defined as an algebraic expression which can be written as a ratio of two polynomial expressions. For simplifying the rational expression, it is necessary to eliminate the common factors in both the numerator and denominator and find the Greatest Common Factor (GCF) of the factor.

Solving Quadratic Equations by Factoring. An equation containing a second-degree polynomial is called a quadratic equation. For example, equations such as $2x^2 + 3x - 1 = 0$, $2x^2 + 3x - 1 = 0$ and $x^2 - 4 = 0$, $x^2 - 4 = 0$ are quadratic equations. They are used in countless ways in the fields of engineering, architecture, finance ...

Here is a set of practice problems to accompany the Quadratic Equations - Part I section of the Solving Equations and Inequalities chapter of the notes for Paul Dawkins Algebra course at Lamar University.

Algebra - Quadratic Equations - Part I (Practice Problems)

So, we are now going to solve quadratic equations. First, the standard form of a quadratic equation is $\{a\{x^2\} + bx + c = 0\}$ The only requirement here is that we have an $\{x^2\}$ in the equation. We guarantee that this term will be present in the equation by requiring $\{a \neq 0\}$.
