Interestingly, the ribosomal elements that HCV-like IRESs exploit for binding to the 40S subunit (rpS1e, rpS26e, rpS27e, rpS28e and ES7) are all eukaryote-specific. The conserved GGG motif in subdomain IIId1 is a major determinant of ribosome binding and initiation activity for all HCV-like IRESs 3,5,6.

HCV-like IRESs displace eIF3 to gain access to the 40S subunit

Four Putative IRESs Cause Aberrant Splicing of Retroviral RNA. To screen the putative IRESs for 3′ ss using a more sensitive approach, we introduced the IRES-GFP cassettes from the dicistronic plasmids into a murine leukemia virus (MLV) proviral genome (Fig. 2 A).MLV must maintain a balance between its full-length genomic transcript and spliced env transcript to undergo productive replication.

Splicing mediates the activity of four putative cellular ...

Further, the RNAs of many positive-sense (mRNA) viruses have internal ribosome entry sites (IRESs) at their 5′-ends, i.e. subsequences that recruit ribosomes and initiate translation (9,10). In all of the above examples—involving both direct interaction between 5′- and 3′-ends or interaction mediated by binding proteins—particular ...

The ends of a large RNA molecule are necessarily close
In spite of the ample literature on the type I IRESs (3,4), we have not yet a clear idea about the events that occur in the course of ribosome entry onto these IRES elements.Moreover, we may not even be sure that we have already identified all participants of the internal entry since no systematic screening for factors involved in this process has ever been performed.

The common ITAF for Type 2 IRESs is the pyrimidine tract binding protein (PTB), but the FMDV IRES additionally requires ITAF 45 (Pilipenko et al , 2000). Initiation on Type 1 IRESs has not been reconstituted in vitro , and much less is known about its mechanism.
